Hackathon Participant Repositories: Snapshot, 4 Nov 2026

Source: GitHub repository search (phrase queries on the hackathon name), run on 4 Nov 2026. Full list: BEBOP_Hackathon_Participant_Repos.csv.

1. How many

Measure	Count
Public repos found (created since 20 Oct 2026), unique GitHub accounts	718 repos, 700 accounts
Last pushed on Oct 31 / Nov 1 / Nov 2 / Nov 3	27 / 49 / 73 / 276
Last pushed today (Nov 4)	153
Repos with a push on Oct 3	0 (hackathon opened Oct 26; earliest repo in the set was created Oct 20)

2. Repos closest to BEBOP (verifiers, measurement, camera safety, robotics)

Repo (participant)	Last push	What it does (from its README)	Overlap with BEBOP
SizanobuhleZulu/BONISA	Nov 2	Phone video to a physics measurement (g) with uncertainty; refuses to output a number if eight checks fail. SAM 3.1.	**Highest**: abstains on weak evidence, other domain
tamzid2001/sceneproof	Oct 27	Deterministic constraint engine verifies robot scenes after 'what if' changes; models explain, code decides.	High: same 'models propose, code decides'
SANGRAMLEMBE/landproof	Nov 3	Drone emergency landing; SAM 3.1 checks hazard claims, deterministic verifier refutes unsafe zones.	High: evidence-gated safety verdict
surasakphetmanee/mars-rover-edgecheck	Nov 1	Per-command rover safety checker validated against PRISM; SAM 2.1 features. Reports measured numbers.	Medium: verified safety, probabilistic
WaleedOH/clearline	Nov 3	Pharma line clearance: SAM 3.1 outlines leftovers, Muse Spark judges, QA signs record.	Medium: camera check, different 'clearance'
manju89jay/navfail	Oct 27	Agent that investigates Nav2 navigation failures in Gazebo.	Medium: failure diagnosis
allenvarghese05/telltale	Nov 4	Meta AI investigates vehicle crashes; a deterministic checker makes it prove claims.	Medium
duneon97/evidence-gated-repair	Oct 31	Repair agent that refuses to claim a fix it cannot prove.	Low-medium: refusal idea, code domain
Harpith2/25worlds	Nov 2	Spatial intelligence for robots navigating unseen spaces from one camera.	Low-medium
abelxmendoza/RobotForge-Hackathon	Nov 4	Describe a robot in words, get a validated digital twin.	Low

Participant = the GitHub account that owns the repo. I read each README's opening section only; I did not audit code, results or whether any of these were submitted.

3. What this means for BEBOP

The 'models propose, deterministic code decides' idea is common here, and BONISA already abstains on weak evidence in another domain. A repo claiming novelty on that alone will lose. BEBOP's defensible edge is narrower: a measured, head-to-head **false-approval benchmark on scenes where the evidence is truly insufficient**, with the three baselines. Read BONISA and SceneProof before you present.

4. Limits of this list

GitHub search finds only public repos that mention the event in the name, description or README, so it misses private repos and participants with no repo. 'Last pushed' is the most recent push, not the first, so a repo shown on Nov 3 may have started earlier. A repo existing does not mean a submission was made, and some matches may be unrelated to the hackathon.
